

Sea-ice initialization for decadal predictions with EC-EARTH

Klaus Wyser, Mihaela Caian,
Torben Königk, and Colin Jones
Rossby Centre, SMHI
Chris König Beatty, UCL

Decadal predictions for CMIP5

- EC-EARTH model (IFS-OASIS-NEMO)
- EC-EARTH consortium tests full-field and anomaly initialization for decadal predictions
- Ocean initialization from NEMOVAR re-analysis, but NEMOVAR doesn't include sea-ice
- How to initialize sea-ice?
In particular sea-ice thickness?

Sea-ice initialization

- Test 4 different methods for sea-ice initialization:
 - Full field from a forced NEMO run
 - Climatology from a forced NEMO run
 - Model climatology
 - Anomaly from a forced NEMO run added to the model climatology

Experimental setup

- Start decadal simulations in 1970, 1980, 1990 and 2000
- Initial conditions for atmosphere from ECMWF re-analysis
- Initial conditions for ocean from NEMOVAR, use anomaly initialization
- 4 different methods for sea-ice initialization

Experimental setup 2

- Initial conditions for sea-ice
 - Full field from NEMO run forced by NCEP/NCAR re-analysis
 - Climatology from forced NEMO run
 - Climatology from a long EC-EARTH run
 - Anomaly from forced NEMO run added to EC-EARTH model climatology

Sea-ice initial conditions NH

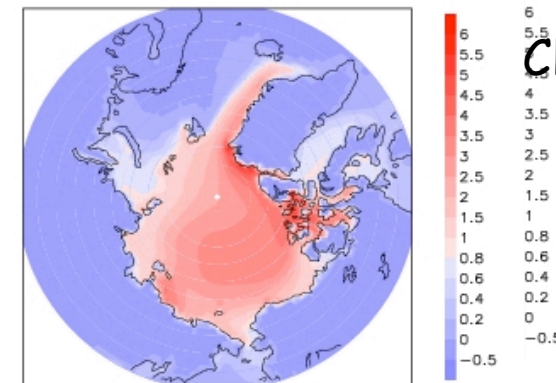

Full field

Climatology forced run

Climatology EC-EARTH

Anomaly forced run
+ model climatology

Initialization date 1-Jan-1990

Sea-ice initial conditions SH

Climatology EC-EARTH

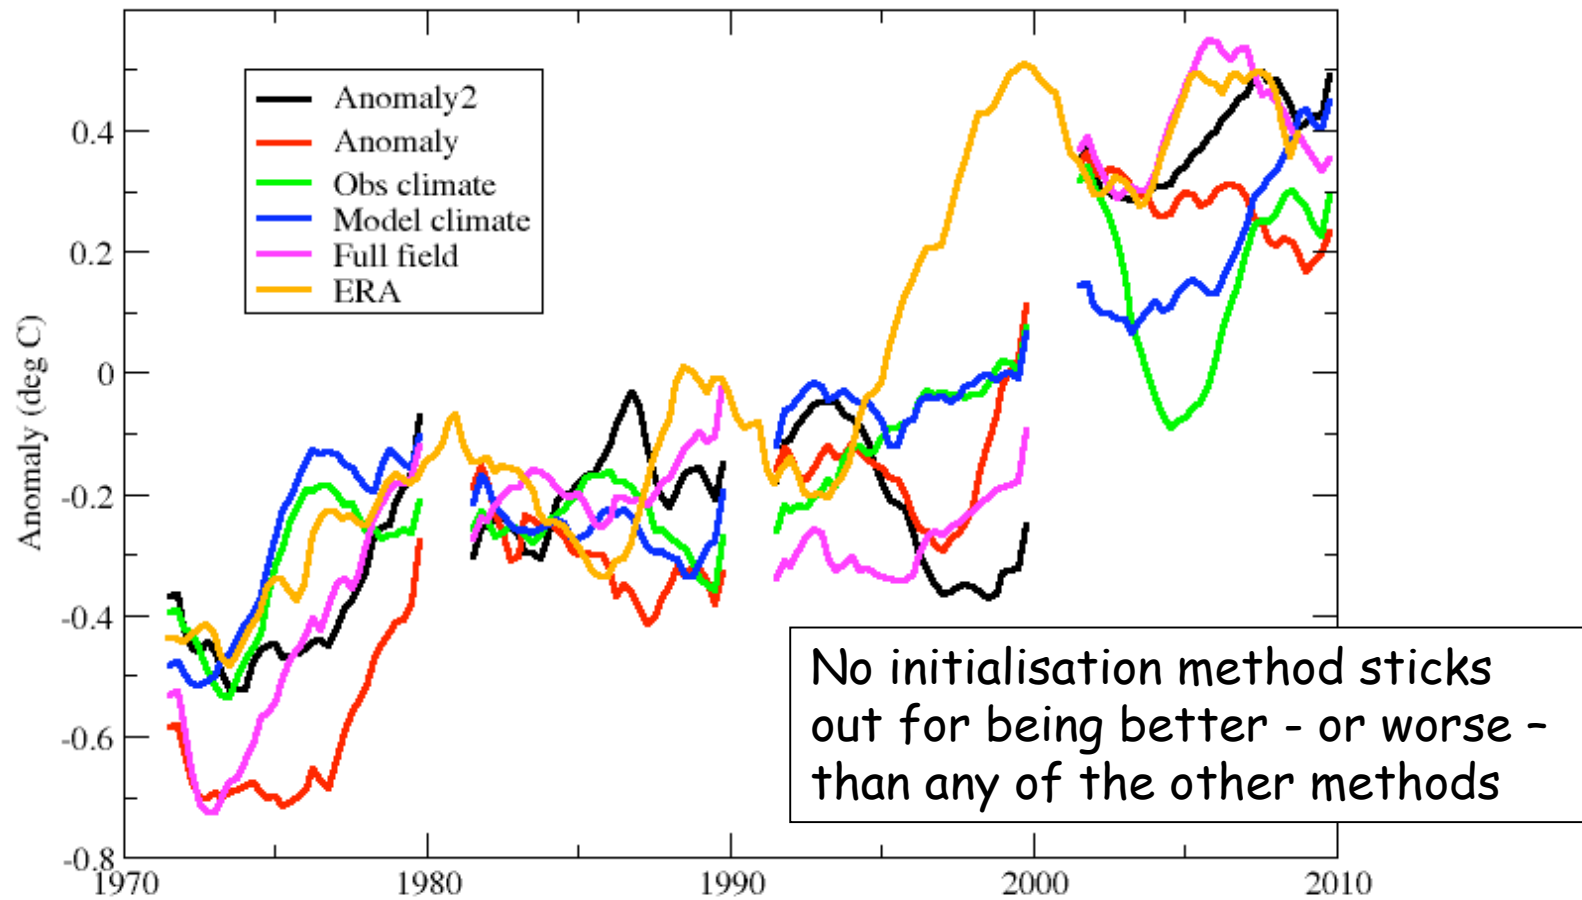

Initialization date 1-Jan-1990

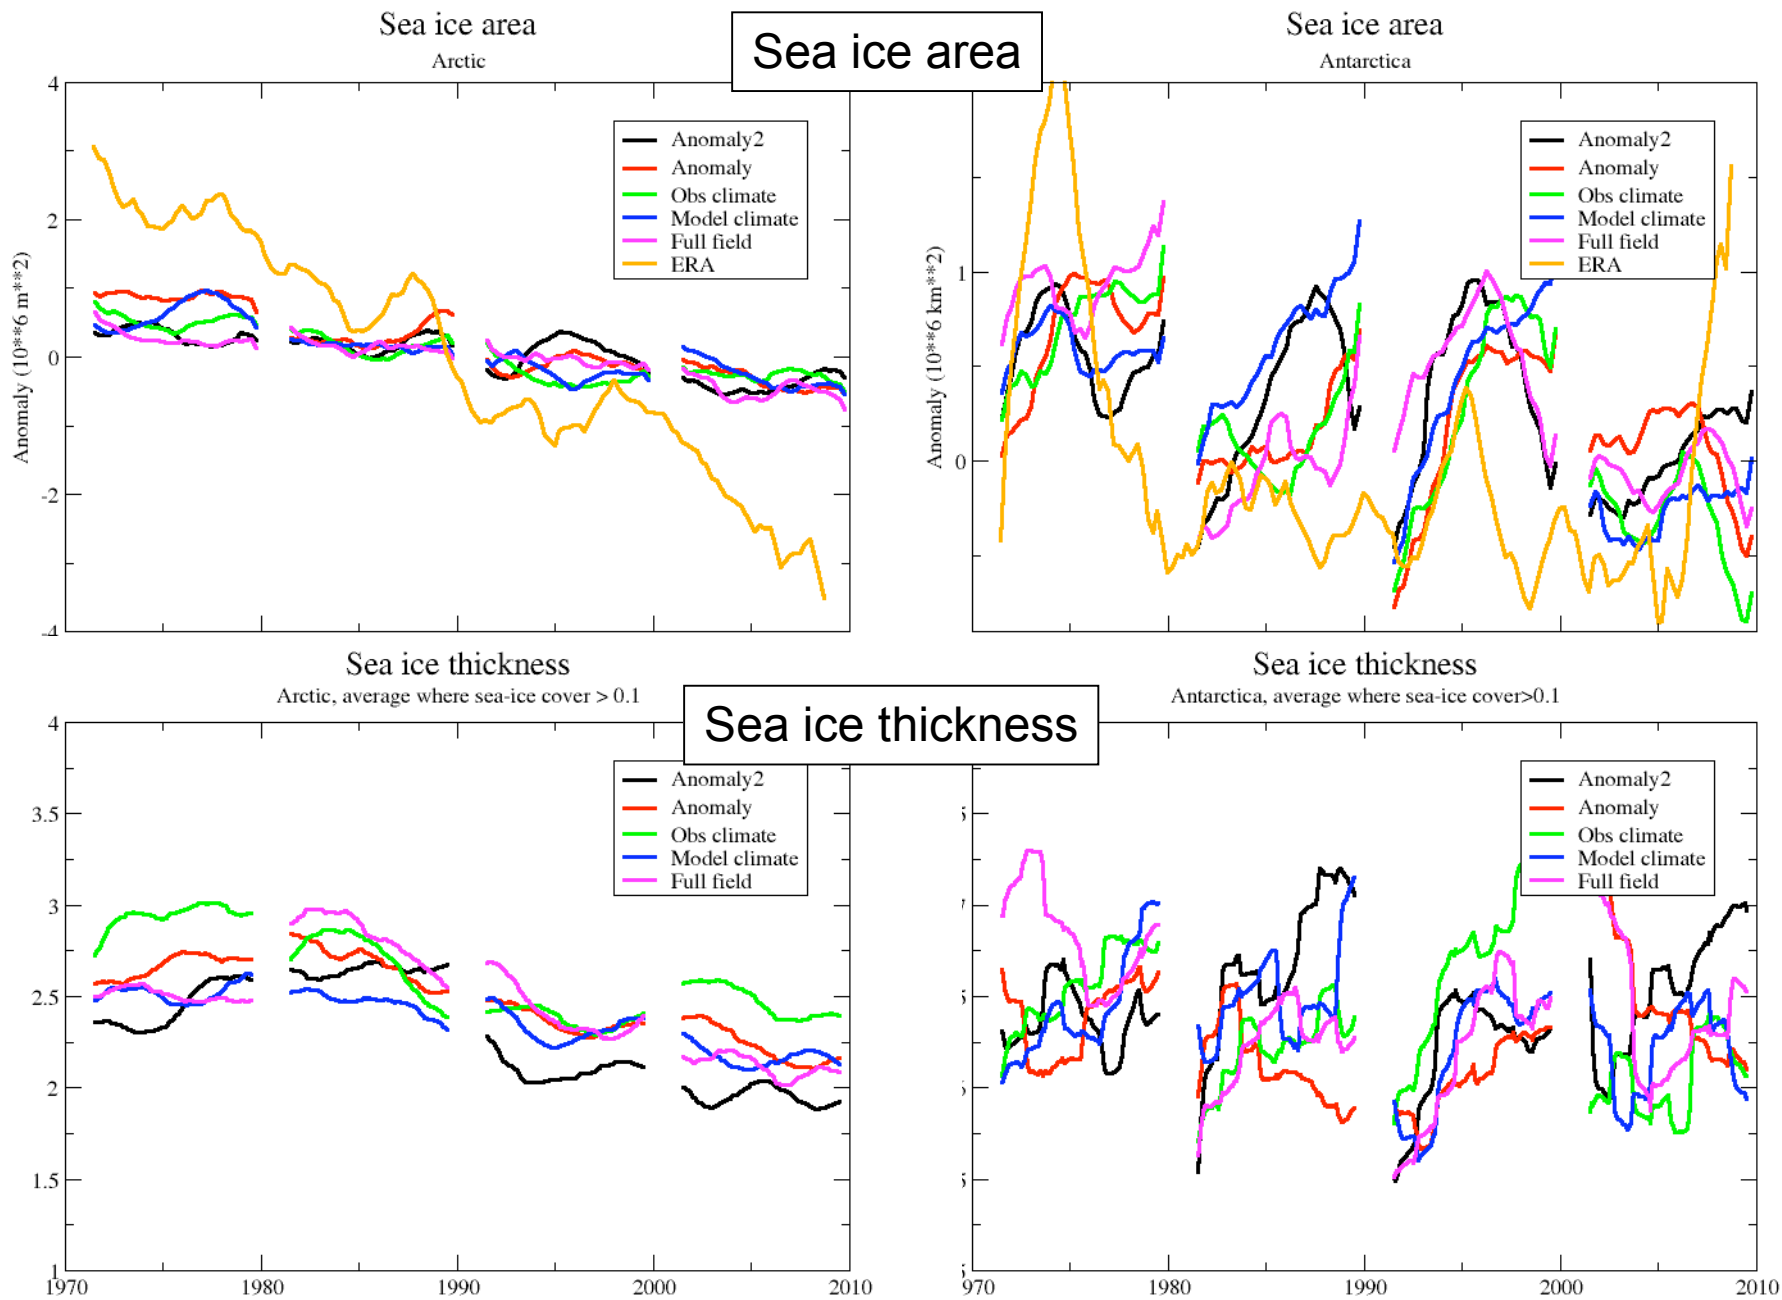

Results

Seasonal anomalies
3-yr running mean

Sea surface temperature

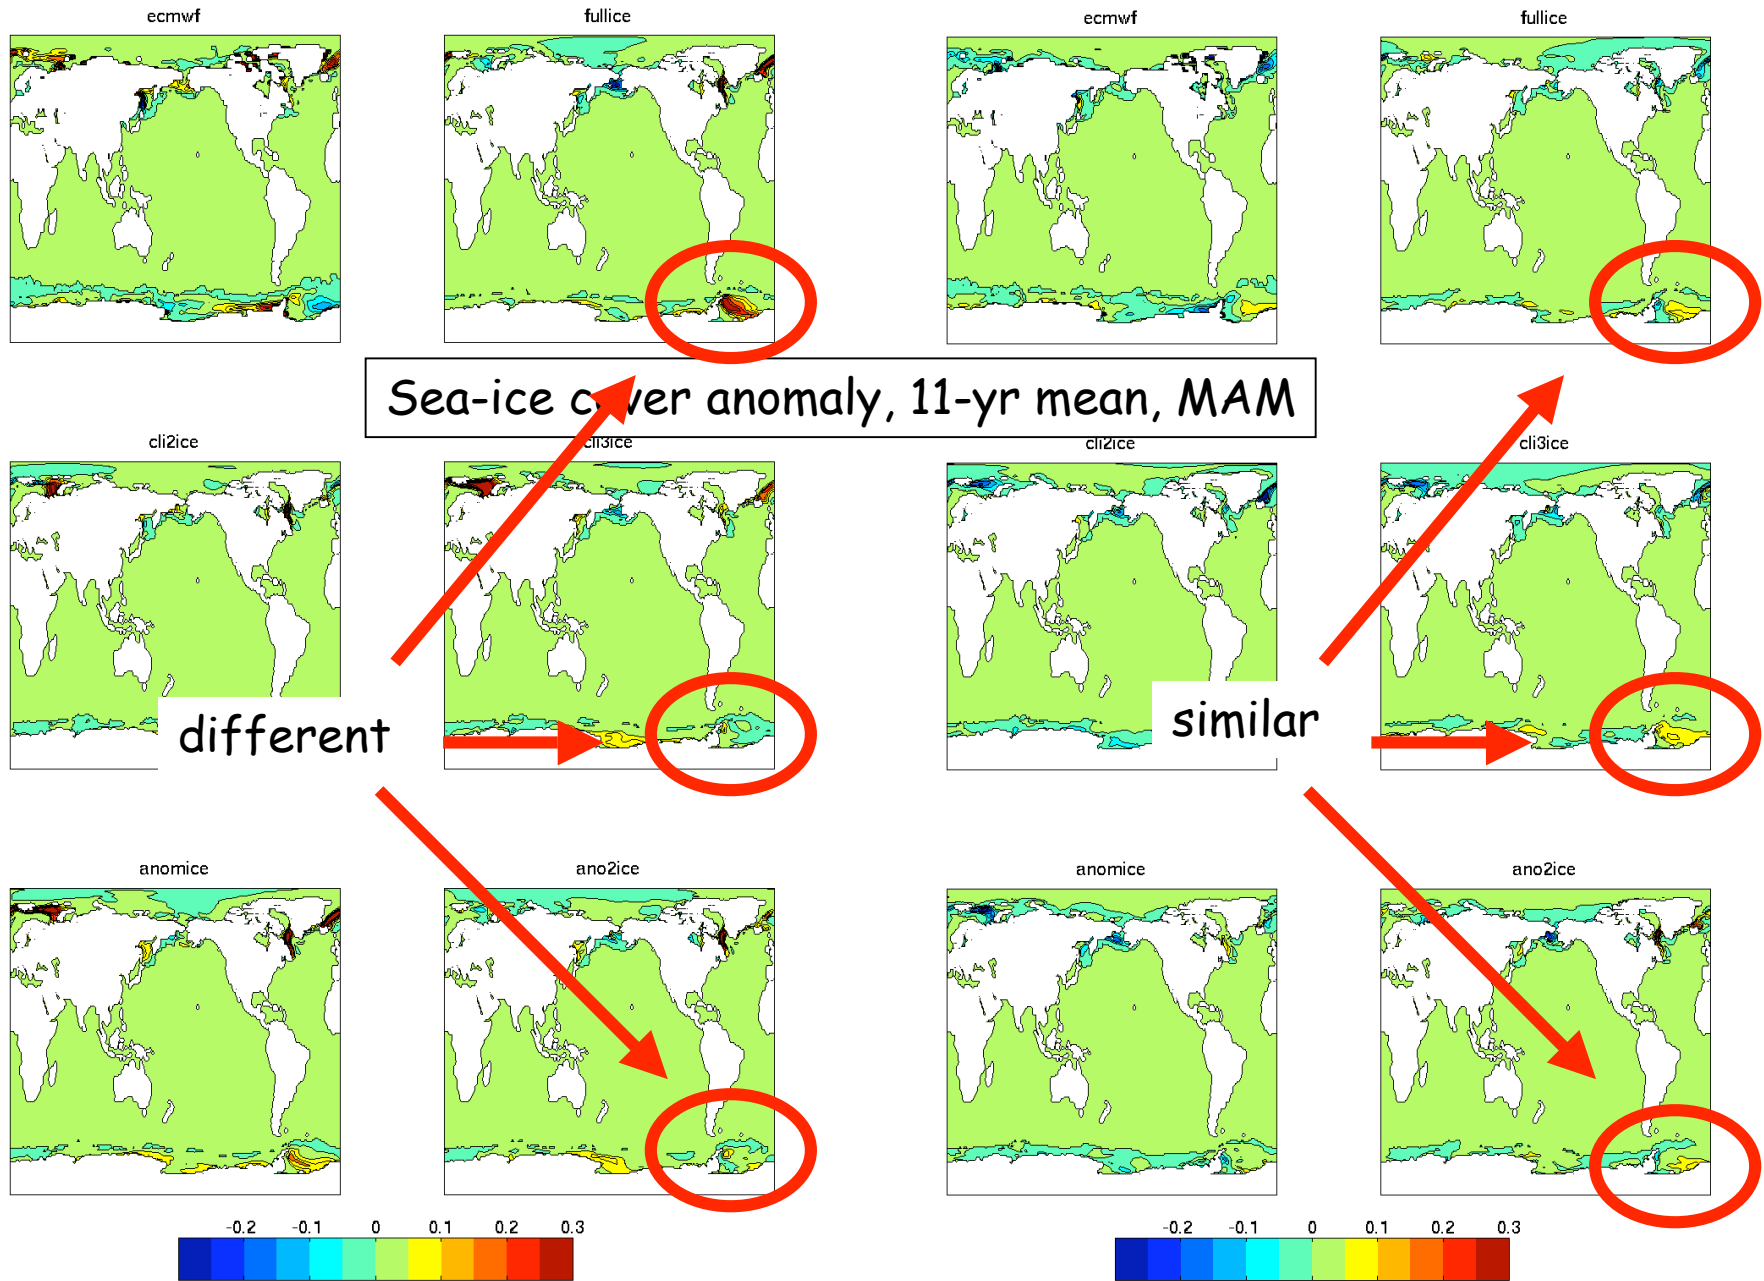

North Atlantic

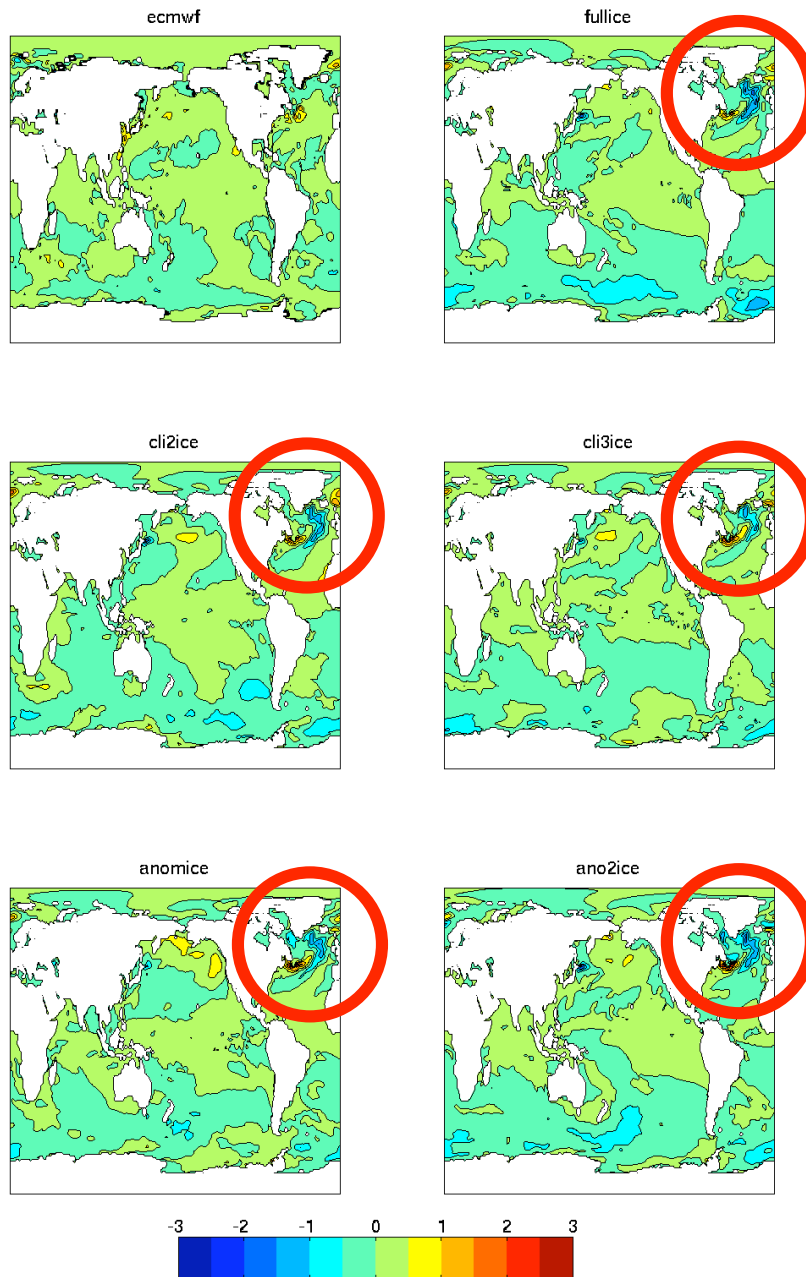

sea-ice anomaly mean | period: 1970-1980 season: MAM

sea-ice anomaly mean | period: 1990-2000 season: MAM

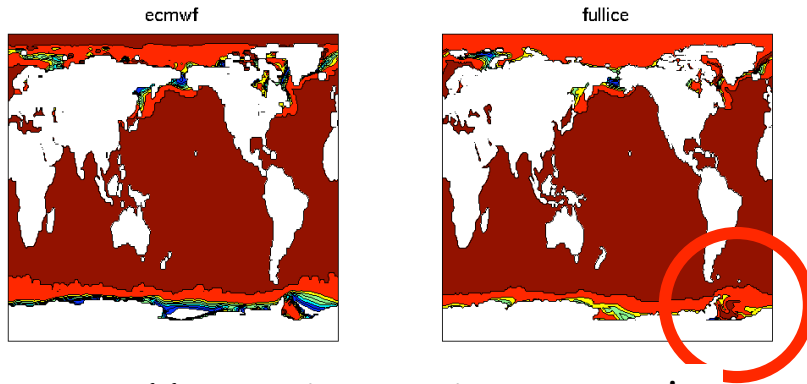

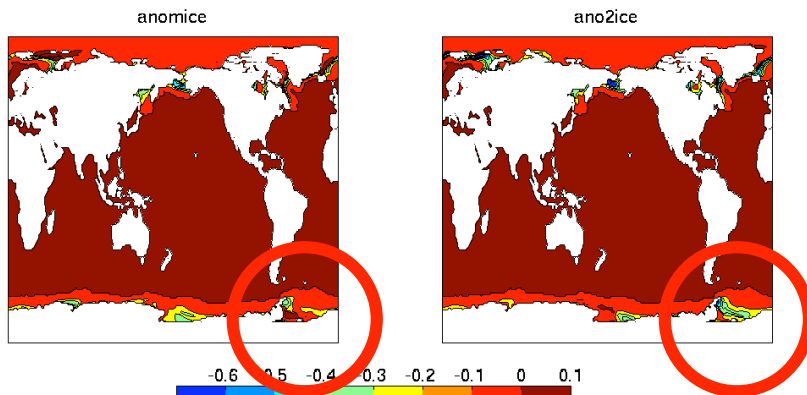

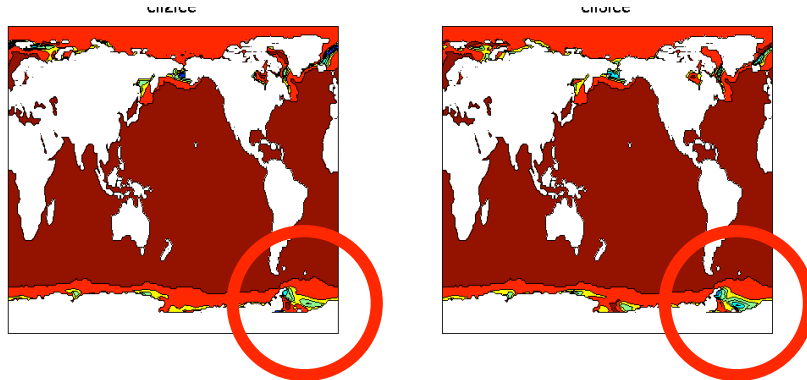

SST anomaly, 11-yr mean, DJF

Similar structure and magnitude
independent of sea-ice initialization

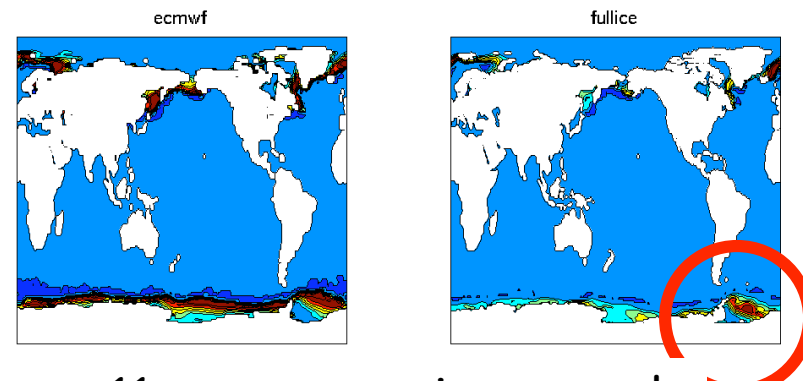

sea-ice anomaly min | period: 1970-1980 season: MAM

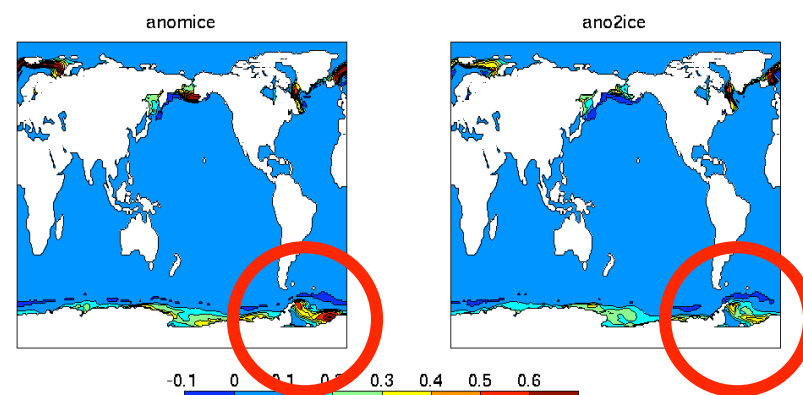

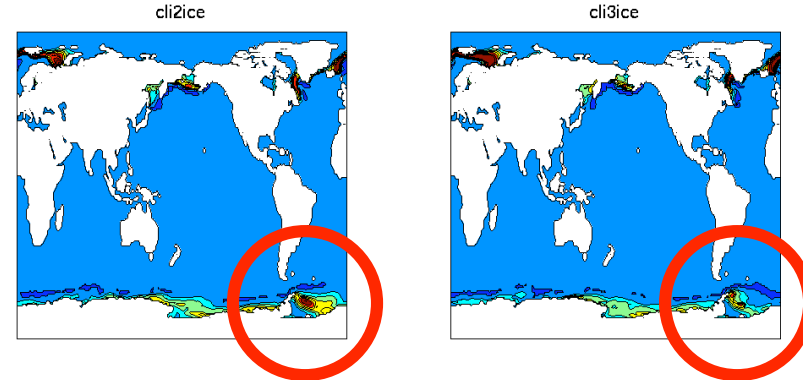

11-yr min sea-ice anomaly

sea-ice anomaly max | period: 1970-1980 season: MAM

11-yr max sea-ice anomaly

Conclusions

- 4 different initialization methods for sea-ice have been tested
- Different initialization methods yield different SST and sea-ice in the decadal simulations
- Annual means and decadal means are different, but there is no systematic behaviour
- None of the tested sea-ice initialization methods is superior or inferior
